

-21-

CLAIMS

We claim:

1. A method of fabricating a heat exchanger comprising:
- 2 a) providing a plurality of generally parallel tube runs of a flattened  
heat exchange tube having a major dimension and a minor dimension;
- b) providing a plurality of plate fins, each having a plurality of tube  
slots approximately equal to the number of tube runs, each slot opening to an edge of  
the associated fin and having
- i) a shape corresponding to the cross-sectioned shape a tube  
run to be received in the slot,
- ii) a depth less than the major dimension of the tube run to  
be received in the slot, and
- iii) a width approximately equal to or slightly less than the  
minor dimension of the tube run to be received in the slot;
- c) fitting the tube runs snugly into corresponding slots in each of the  
fins such that an edge of each tube run extends a distance out of the slots in which it is  
received;

-22-

16 d) locating the assembly resulting from step c) on a supporting  
surface with said tube run edges in contact with said supporting surface and with said  
18 plate fins extending above said tube runs; and

e) subjecting said assembly to an elevated temperature sufficient to  
20 braze said fin to said tube runs while said assembly is on said supporting surface and in  
the absence of brazing fixtures holding said fins and said tube runs in assembled  
22 relation.

-23-

5. The method of claim 1 wherein the cross-section of said tube runs is  
2 oval-shaped.

6. The method of claim 1 wherein said fins are curved at locations between  
2 said slots.

7. The method of claim 1 wherein said fins and said tube runs are formed  
of aluminum and/or alloys thereof.

8. A method of fabricating an aluminum and/or aluminum alloy heat  
exchanger comprising the steps of:

a) assembling a plurality of plate fins having open ended slots to a  
4 plurality of tube runs having the same cross-section shape as the slots such that an edge  
of each tube run extends a short distance out of the slots in which it is received;

6 b) locating the assemblage resulting from step a) on a supporting  
surface with said tube run edges contacting said supporting surface and said fins above  
8 and out of contact with said supporting surface;

-24-

10 c) locating an aluminum braze alloy at the interfaces of said tube  
runs and said fins; and

12 d) subjecting the assembly resulting from the preceding steps to  
aluminum brazing temperatures in the absence of brazing fixtures holding said tube runs  
and said fins in assembled relation for a time sufficient to allow said fins to settle under  
gravitational forces onto said tube runs.

9. The method of claim 8 wherein step c) is performed by cladding one or  
both of said fins and said tube runs with said aluminum braze alloy prior to the  
performance of step a).

2 10. The method of claim 8 wherein said tube runs are of flattened tubing  
having a major dimension and a minor dimension and said slots have a depth somewhat  
less than said major dimension.

2 11. The method of claim 8 including the step of providing the fins with  
curved sections between said slots.

-25-

12. A method of fabrication of a heat exchanger comprising the steps of:

- 2 a) assembling a plurality of plate fins having open ended slots to a  
plurality of tube runs having the same cross-section shape as the slots such that an edge  
4 of each tube run extends a short distance out of the slots in which it is received;
- b) locating the assemblage resulting from step a) on a supporting  
surface with said tube run edges contacting said supporting surface and said fins above  
and out of contact with said supporting surface; and
- c) subjecting the assembly resulting from the preceding steps to  
brazing temperature in the absence of brazing fixtures holding said tube runs and said  
fins in assembled relation for a time sufficient to allow said fins to settle under  
gravitational forces onto said tube runs.

13. An aluminum heat exchanger, comprising:

- first and second headers;
- at least one flattened tube extending between and in fluid communication  
4 with said headers and defining a plurality of generally parallel tube runs in spaced  
relation to one another;

-26-

each said tube runs having opposite edges defining a tube major dimension and interconnecting side walls defining a tube minor dimension and a plurality of interior ports;

a plurality of plate fins arranged in a stack and each having a plurality of open ended tube run receiving slots, one for each tube run, each slot having a shape generally that of the cross-section of the tube run to be received therein, a width equal to or just less than the minor dimension of the corresponding tube run and a depth somewhat less than the major dimension of the corresponding tube run;

each said tube run being nested within corresponding slots in said fins with one of said edges of each tube run located outwardly of the corresponding fin; and

said headers, said tube runs and said fins comprising a brazed assembly.

14. The heat exchanger of claim 13 wherein said tube runs are defined by individual tubes.

15. The heat exchanger of claim 13 wherein said tube runs are defined by at least one serpentine tube.

-27-

2 16. The heat exchanger of claim 13 wherein said slots are at least partially  
bounded by flanges brazed to said tube runs.

2 17. The heat exchanger of claim 13 wherein said slots have flange free edges  
brazed to said tube runs.

2 18. The heat exchanger of claim 13 wherein said fins are curved at locations  
between said slots.

2 19. The heat exchanger of claim 13 wherein said plate fins are elongated and  
said slots open to one elongated edge thereof, the other elongated edge being  
uninterrupted by said slots.

2 20. The heat exchanger of claim 19 including a stiffening bead between said  
other elongated edge and said slots.

2 \* 21. The heat exchanger of claim 18 wherein said plate fins are elongated and  
said slots open to both elongated edges thereof.

-28-

Subj

2 22. The heat exchanger of claim 21 wherein the slots opening to one of said elongated edges are aligned with the slots opening to the other of said elongated edges.

2 23. The heat exchanger of claim 21 including an elongated uninterrupted band extending in the direction of elongation of said plate fins located between the slots opening to said one elongated edge and the slots opening to said other elongated edge.

2 24. The heat exchanger of claim 21 wherein said tube runs are defined by the legs of U-shaped tubes, one of said legs of each U-shaped tube being disposed in a slot opening to one elongated edge of said plate fin and the other leg being disposed in a slot opening to the other elongated edge.

2 25. The heat exchanger of claim 24 wherein the slots opening to opposite ones of said elongated edges are aligned and the legs of each said U-shaped tube are located in aligned ones of said slots.

-29-

2 *sub 21* 26. The heat exchanger of claim 25 wherein each of said legs of each of said U-shaped tubes includes an angled twist of an angle up to and including 90° immediately adjacent the bight of the corresponding U-shaped tube.

27. The heat exchanger of claim 13 wherein said parallel tube runs are defined by a plurality of U-shaped tubes, each having two parallel legs connected by a bight and there are two sets of said plate fins, one set disposed on corresponding first ones of the legs and the other set disposed on corresponding others of the legs.

*sub B2* 28. The heat exchanger of claim 27 wherein each of said legs of each of said U-shaped tubes includes a 90° twist immediately adjacent the bight of the corresponding U-shaped tube.

2 *sub B1* 29. A heat exchanger core comprising:  
a plurality of generally parallel tube runs formed of flattened, multi-port tubing; and  
4 a plurality of plate fins in a stacked relation and having spaced openings sufficient to receive said tube runs;

-30-

6           said tube runs being disposed in said openings and having a major  
dimension brazed to the plate fins about said openings;

8           the parts of said plate fins between the openings being arcuate in a  
direction generally transverse to said major dimension to thereby increase the surface  
10 area of the fins between the openings without the need to increase the spacing between  
adjacent openings.

30.   The heat exchanger of claim 29 wherein said openings are slots extending  
into the fins from one edge thereof.
